## **BIOCIDAL ACTIVITY**

### **1. DESCRIPTION**

Sodium dichloroisocyanurate (NaDCC) is also known as sodium troclozene and sodium dichloro-s-triazine trion. The ingredient is the sodium salt of 1,3-dichloro-1,3,5-triasine-2,4,6 (1H,3H,5H).

NaDCC has the general specification of the chlorine and hypochlorites. The biocidal activity of the chlorine products generally applied to the NaDCC products. However, NaDCC has the definite advantages against other chlorine products.

The product is remained consistently very active in wide pH range. The product produces acidic solutions with more biocidal activity than alkaline hypochlorite products. NaDCC contains uniquely combined chlorine which is released in the presence of high chlorine, ie when organic contamination is present.

### **2. Biocidal Activity**

The long and widespread use of chlorine compounds has been introduced in laboratories (in-vitro) and field (in-vivo). The biocidal activity of the chlorine compounds increased by different factors.

pH: pH is important enhancing. Low pH (acidic solutions) has bigger activity.

Concentration: high concentration is higher effectiveness.

Heat: higher heating is more effectiveness.

Organic Contamination: It is noted that NaDCC has better capacity against hypochlorites (more than 4 times). Especially sensitive and high risky areas (catering, operation room etc.) and farming environments the cleaning is recommended before disinfection.

Exposure time: longer exposure time is higher effectiveness.

Surface: mixed surfaces on configurations (joints, tubes etc) complicated the disinfection of microorganisms. The type and level of the microbial contamination affect the effectiveness.

## 1.0 INTRODUCTION

Sodium dichloroisocyanurate (NaDCC) is also known as sodium troclozene and sodium dichloro-s-triazine trion. The substance is the sodium salt of 1,3-dichloro-1,3,5-triazine-2,4,6 (1H, 3H, 5H) -trione (dichloroisocyanuric acid).

NaDCC has general properties of chlorine and hypochlorites. The biocidal activity of chlorine products is generally applicable to NaDCC products. However, NaDCC has definite advantages over other chlorine products.

- The product remains active in a wide pH range (6 - 10)
- The product produces acidic solutions having a greater biocidal activity than alkaline hypochlorite products
- The product contains uniquely bound (conceivable) chlorine, which is freed up when there is a high chlorine requirement ie organic contamination

## 2.0 BIOCIDAL ACTIVITY

The long history and extensive use of chlorine compounds have been introduced in laboratories (in-vitro) and field (in-vivo). The biocidal activity of chlorine compounds has been increased by several factors.

pH: pH is an important enhancer. Low pH (acidic solutions) is more active.

Concentration: High concentration is higher efficacy. Note: the concentration of the available chlorine is in the range of. . (1 p.p.m. = 1 mg per liter, 1.25% hypochlorite solution = 10,000 ppm)

Heat: high heat is more effective.

Organic pollution: organic pollution (or reducing agents) reduces the effectiveness. It should be noted that NaDCC has a better capacity than hypochlorites (more than 4 times). Especially in sensitive and high-risk areas (food processing, operating theater, etc.), cleaning is advised before disinfection in the farming environment. Water hardness does not have any biocidal action on chlorine products.

Exposure time: longer exposure is higher efficacy.

Surface: mixed surfaces or configurations (joints, tubes, etc.) make disinfection of microorganisms difficult. The type and level of microbial pollution affects the effectiveness. The following durability is a rough guideline for reduced disinfection activity.

# NaDCC

# KLORTAB®

## NaDCC

Bacterial Spores  
Bacillus subtilis  
Clostridium spp.

Mycobacterium  
Mycobacterium tuberculosis  
Mycobacterium smegmatis

Nonlipid or small viruses  
Poliomyelitis

Fungi  
Aspergillus spp.  
Candida albicans

Vegetative bacteria  
Escherichia coli,  
Pseudomonas aeruginosa,  
Staphylococcus aureus,  
Salmonella spp.

### 3.0 Activity of NaDCC

Below is a summary of the biocidal activity of NaDCC against bacteria, fungi, mycobacteria, spores and viruses.

The data includes many in-vitro studies and printed papers that are independently conducted on KLORTAB NaDCC products.

# KLORTAB®

## NaDCC

21. The fungicidal effects of 15 disinfectant against 25 fungal contaminants that common in the production of bread and cheese. Bundgaard – Nielsn, K and Nielsen P.V.J. Food Protect. 59, 268 – 275, 1995 (673).
22. The determination of fungicidal activity of NaDCC mixture. Test Report No. 995, 209 – 210, Midac Laboratoire, Lille, France, August 1995 (AFNOR NFT 72 201)
23. Tests for antibacterial effects of different disinfectants on bacterial responsibility for fungal mastitis. Eno, Y. and Takatori, K. Stockbreeding Research, 39, 74-76, 1985 (349).
24. Compared mycobacterial efficacy of chemical disinfectants in suspension and carrier tests. Best, M., Sattar, S.A., Springthorpe, V.S., and Kennedy, M.E. Appl. and Environ. Microbiol., 54, 2856 – 2858, 1988 (161).
25. Comparative testing of disinfectants against *Mycobacterium tuberculosis* and *Mycobacterium terrae* in a quantitative suspension test. van Klinger, B. and Pullen, W., J. Hosp. Infect., 10, 292 – 298, 1987 (66).
26. Studies on sporicidal and fungicidal activity of disinfectants. Lensing, H.H., and Oei, H:L. Zbl. Bakt. Hyg., I. Abt. Orig., B181, 487 – 495, 1985 (765).
27. The sporicidal properties of some halogens. Cousins, C.M., and Allan, C.D., J. Appl. Bact. 30, 168 – 174, 1967 (400).
28. Determination of the sporicidal activity of the NaDCC mixture. Test Report No: 95 210 231. Midac Laboratoire. Lille, Fransa. Ağustos 1995 (AFNOR NFT 72 231)
29. The sporicidal activity of Sodium Dichloroisocyanurate, peroxygen and glutaraldehyde disinfectants against *Bacillus subtilis*. Coates, D., J. Hosp. Infect. 32, 283 – 294, 1996 (807).
30. Lettuce big-vein virus symptoms in protected and unprotected lettuce droplets and its vector *Olpidium barssiae* control. Horticultural Research Institute. Annual Report 1992 / 3. Ekim 1993
31. The virucidal activity of chloroisocyanurates. Determination of the virucidal activity of the 3 disinfectant against the AFNOR NFT 72 180 standard. Laboratoire d'Hygiene et de Recherche en Sante Publique. Vandoeuvre Les Nancy, Fransa. Aralik 1992.
32. The virucidal effects of disinfectants in some animal viruses. Hirata, K., ve Goto, H. Obihiro University, Medical Agriculture and Veterinary, Obihiro, Japan. 508 – 511, March 1986.
33. A surface test for the virucidal activity of disinfectants. Initial work with the herpes virus. Bloomfield, S.F., Smith-Burchnell, C.A., and Delgleish, A.G., J. Hosp. Infect. 15, 273 – 278, 1990 (369).
34. Evaluation of Solprogel disinfectant effect against Human Immunodeficiency Virus type 1 (HIV - 1). Hernandez, A., Belda, F.J., Dominiguez, J., Matas, L., Gimenez, M., Caraballo, M., Ramil, C., ve Ausina V. J. Hosp. Infect. 34, 223 – 228, 1996 (893).
35. Basically the dichloroisocyanuric acid sodium salt for enteroviruses and the virucidal activity of detergent compounds. Shirobakov, V.P., Nikitenko, A:G., ve Yakimenko, A.I. 205 – 211, 1975 ( 343).

NaDCC

<b>BACTERIA</b>	
Aerobacter aerogenes	Gas-forming microorganisms
Bacillus anthracis	Bacillus that causes anthrax in humans and in some animals (Davaine's bacillus)
Bordetella bronchiseptica	A gram-negative bacterium that causes respiratory disease
Brucella spp	A gram-negative bacterium with a brucellosis effect (The disease affects people through animal food, with fluctuating fever, sweating, weakness and muscle soreness, and a clear disease pattern.
Enterococcus faecalis	A gram-positive bacterium grouped as small chains and relatively resistant to light
Erysipelothrix	A gram-positive bacterium
Escherichia coli	Bacterial species usually found in large intestines without disease and often causing infection in the urinary system
Klebsiella pneumonia	Klebsiella spp., Accompanied by other bacterial pathogens in respiratory tract infections, primarily lobar pneumonia,
Listeria innocula	A gram-positive bacterium
Listeria monocytogenes	Meningitis and encephalitis in adulthood, Listeria species causing pregnancy to fall through the fetus.
Micrococcus luteus	A gram-positive bacterium
Proteus vulgaris	Proteus genus, which usually lives on spoiled materials and can cause urinary tract infection in some cases.
Pseudomonas aeruginosa	A gram-negative bacterial species that is found in the urinary system, ear and eye infections and in infected wounds and sometimes responsible for infection
Salmonella spp	A kind of bacteria, gram negative rods. They live in humans and animals as parasites and often carry disease-causing properties
Salmonella paratyphoid A	Salmonella species that cause type A paratyphoid.
Salmonella typhi	Salmonella species that cause typhoid.
Shigella spp	Some species are causing bacterial dysentery immature, gram-negative bacteria
Staphylococcus aureus	Apse etc. A gram-positive bacterial strain with rounded shape that causes cystic lesions.
Streptococcus spp	Gram-positive round, stationary bacteria that are arranged in chains. (Streptococci are classified as alpha hemolytic, beta hemolytic and non hemolytic according to hemolytic activity in the culture medium consisting of bloody agar.
Yersinia enterocolitic	Gram-negative bacterial species that cause inflammation in the small intestine and colon, some of which are pathogenic

NaDCC

<b>FUNGUS</b>	
Aspergillus	Some species are a type of fungus that settles in various organs and causes disease.
Candida albicans	It is usually a saprophytic fungus that shows thin extensions in the form of fibers that cause vaginosis in females and thrush in infants.
Cryptococcus neoformans	It is a fungus type
Gypseum trichopyhton	It is a type of fungus that causes disease by locating in hair and skin hairs.
Trichosporon cutaneum	A fungus that causes trichoporosis.
<b>MYCOBACTERIUM</b>	
Mycobacterium smegmatis	A long, gram-positive bacterial strain in the form of a rod
Mycobacterium tuberculosis	Type of mycobacteria causing tuberculosis, Koch basil.
<b>SPORES</b>	
Bacillus anthracis	Bacillus (Davaine's bacillus), which causes anthrax in man and in some animals,
Clostridium perfringens	It is a type of bacterium that contains gram-positive spore bacilli that live in an oxygen-free environment, causing gaseous gangrene. Clostridium welchii.
Clostridium tetani	Clostridium species causing tetanus.
<b>VIRUSES</b>	
Adenovirus	A group of virus-containing DNA.
Avian Infectious Bronchitis	A group of viruses that cause infectious bronchitis and spread from birds.
Herpes Simplex	The same named virus is caused by a marked acute infection with the formation of common small vesicles on various skin and mucosa areas.
Human Immunodeficiency	AIDS
Japanese encephalitis	A certain viral epidemic encephalitis seen in remote far east countries, mainly Japan.
Poliomyelitis	Inflammation of spinal cord gray matter, viral disease, childhood, polyomyelitis, which starts suddenly with fever, headache, muscle aches, nausea and vomiting, which is seen in children, and which is atrophy and numbness in the muscles.
Reovirus	Abbreviated words of "respiratory enteric orphan virus"

NaDCC
